

Phase I: Early ROM & Protect Repair (*0 to 6 weeks*)

- Splint and postop dressing remains in place until 10-14 days postop.
- After splint is removed, transition to Hinged Elbow Brace
 - Worn at all times (except showering, hygiene)
- Avoid varus forces across the elbow until 3 months postop.
- Initiate active elbow range of motion:
 - Active and passive elbow ROM to full flexion
 - Active and gentle passive elbow extension
 - Elbow extension to 30 (with forearm pronated) week 2
 - Elbow extension to 20 (with forearm pronated) week 3
 - Elbow extension to 10 (with forearm pronated) week 4
 - Elbow extension to 0 (with forearm pronated) week 5
 - Forearm pronation/supination ROM with elbow at 90 degrees flexion
- Grip and wrist/hand AROM immediately.
- Perform supination ROM only with the elbow flexed to 90 degrees.

Phase II: Full ROM and function (*>6 weeks*)

- Advance ROM:
 - Full elbow and forearm ROM out of HEB
 - Terminal elbow extension performed with the forearm neutral or pronated until 3 months.
- Initiate elbow and forearm strengthening.
- Avoid varus forces across the elbow until 3 months postop.
- Avoid activities creating axial load to involved extremity until 3 months postop.
